Project: BusyNotFree

Overview

BusyNotFree is a Java command-line application that helps freelancers manage clients, projects, dated tasks and events. It supports saving work between sessions. My contributions focus on deleting records safely and recovering deleted projects while preserving their relationships and identifiers.

Summary of Contributions

- **Code contributed:** tP Code Dashboard. **TODO-01:** Replace this general link with my individual CF36 contribution link from the course Project List Page.
- **Enhancements implemented:**
  - **Deletion with confirmation:** Implemented `project.delete`, `client.delete`, `client.delete_note`, `task.delete` and `event.delete`. Prompts identify the selected record before requiring `yes` or `no`; invalid answers preserve the pending operation, and end of input cancels it. Client deletion rejects clients with projects, preventing broken ownership links. Notes are numbered to support selecting the correct note. Evidence: project deletion, confirmation.
  - **Trashcan and project recovery:** Implemented `trashcan.list` and `trashcan.restore PROJECT_ID`. Deleted projects retain their tasks and events; deleted clients retain their notes. Restoration preserves original IDs, dates, project status and task completion. It checks client availability and ID conflicts before changing data, and removes the trash entry only after successful registration. Extended storage to retain trash entries across restarts and load older files without a trash section. This required coordinating deletion, model relationships and persistence. Evidence: trashcan implementation.
  - **Design and validation:** Separated snapshot ownership into `TrashcanManager` and command parsing into `TrashcanCommandHandler`. Added tests for missing and invalid IDs/indexes, confirmation, cancellation, preservation of unrelated records, repeated deletion/restoration, snapshot isolation, save/load and prevention of ID reuse. Also implemented the `help` command. **TODO-02:** Add merged team-repository PR links for these enhancements.
- **Contributions to the User Guide:** Documented deletion commands and the Trashcan section, including formats, confirmation, errors, recovery constraints and persistence. Updated the command summary and numbered-note examples.
- **Contributions to the Developer Guide:** Wrote Trashcan responsibilities and shared wiring, explaining snapshot ownership, handler delegation, restoration checks and storage integration. **TODO-03:** List UML diagrams I personally added/updated with evidence, or state that I contributed no UML diagrams.
- **Contributions to team-based tasks:** **TODO-04:** Add verified coordination, integration, release or shared testing tasks, with issue/PR links; omit responsibilities I did not perform.
- **Review/mentoring contributions:** **TODO-05:** Add reviewed PR links and specific examples of useful feedback or assistance to teammates; state "None" if applicable.
- **Contributions beyond the project team:** **TODO-06:** Add forum responses, technical sharing or bugs reported to other teams, with links; state "None" if applicable.
